FORTIS By Sentinel

Advancing Your Protection

Did You Know?

- Every year, hundreds of organizations only discover they have been compromised when informed by a third party.
- After spending an incredible amount of money on security, most organizations still have no detection capabilities for attackers already sneaking around inside their environment.
- Most attacks take place over weeks, months, or even years as attackers patiently attempt to escalate access and uncover your most critical data.

Trick Bad Actors and Improve Threat Detection Using Innovative Decoy Technology

Fortis by Sentinel is proud to partner with Thinkst Canary to provide our customers with the latest threat detection and decoy tools. When deployed properly, Thinkst Canary will lure unsuspecting attackers into areas that appear to contain high value targets, while informing your administrators of the suspicious or malicious activity so they can contain and eliminate the threat.

How It Works

Thinkst Canary devices can be deployed within your environment in under five minutes, even on the most complex networks. It emulates a variety of possible systems down to their network signatures, so attackers can't tell the difference.

The Thinkst Canary system is very user friendly, and operates with a "set it and forget it" approach. Simply add "canaries" to multiple parts of your network, configure alert settings, then breathe easier knowing you'll be informed once a canary has been triggered.

If an attacker moves laterally within your network, an employee accesses restricted areas beyond their set permissions, or an advanced persistent threat (APT) continues to hammer away at your defenses, they will all interact with a properly placed Thinkst Canary so you can catch them before significant damage occurs.

Your organization doesn't need another security dashboard with hundreds of alerts and false positives. Thinkst Canary remains silent until triggered. One alert, when it matters most, and an extremely low rate of false positives.

Management and Integration

Thinkst Canary can be run independently by your IT team, or managed as part of Fortis by Sentinel's security portfolio. It integrates perfectly with any of our offerings, including Fortis ActiveDefense Monitoring, Security Operations Center (SOC) services, as well as Extended Detection and Response (XDR) services. When Thinkst Canary is managed by Fortis, your organization will be immediately notified of alerts so you can decide the appropriate action(s) to take in response.

Benefits

- Deploys in minutes as hardware units, VMWare images, or EC2 instances
- Integrates with virtually every type of environment, no matter how complex
- Easy to use and manage – place the "canaries" on your network, configure settings, then wait
- Minimal alerts, with very few false positives
- Can be managed and/or combined with other Fortis by Sentinel security offerings
