

Advancing Your Protection

SASE Workshop (Secure Access Service Edge)

Are You Protected?

Proper perimeter security for most organizations goes well beyond simply deploying a stack of security products at a primary hub and forcing all network traffic to pass through it.

The perimeter has become increasingly widespread as more remotely and additional resources are shifted to the cloud. This continued digital evolution requires an innovative solution to keep employees and systems safe from new and emerging types of cyber threats. Secure Access Service Edge (SASE) combines cloud-managed SD-WAN with cloud-delivered security to improve the management of your network and related resources while providing adaptive protection for the modern perimeter.

Workshop Overview

- Establish a path to SASE adoption using your existing security and network technologies
- Detail how SASE delivers a seamless multi-cloud architecture while integrating robust, best-in-class security
- Discover a better way to manage security by extending controls to devices, remote users, and distributed locations
- Learn how to prevent unauthorized access, contain breaches, and limit attacker's lateral movement on your network with a Zero Trust Architecture

Benefits of SASE

- Reduce costs and complexity
- Provide centralized orchestration and real-time application optimization
- Ensure a predictable user experience for applications
- Help secure seamless access for users
- Enable more secure remote and mobile access
